Specifications

AF-25 Fragrance System (The Retailer) Coverage 600 m³

The retailer is designed for sensory branding and fragrance dispersal into areas of 600 m³. Designed to be installed in small and tight locations, either indoor or outdoor, the AF-25 will create the signature fragrance be it for Branding, product launches or for that pleasing experience of the companies signature fragrance.

The retailer is versatile, 12 v dc for safety and can be operated from a car battery or via the 230 volts power pack. Other voltages are available and these cover the commercial vehicles such as buses, coaches and trams. The fragrance container, which is a pure fragrance oil is inserted from the top or base of the unit, and the 150 mls will last for 2 weeks depending upon the usage, however if longer periods or required there is an external connection for a larger fragrance container It can be used as an installed system or a hand held unit which can be used to fragrance any venues, be it a room, car, boat or in fact any location.

The controls could not be simpler, with a 12 volt supply connected the AF-25 can be triggered by the push button on the top of the unit. For more complex usage, it can be operated from a custom designed unit or from the timer unit we can supply. This timer units gives the dispersal time and the delay time between fragrance dispersal. Other methods of operation or by means of a movement system that will trigger the unit on persons passing by.

Finally, the AF-25 can be daisy chained, so one timer control can operate up to six AF-25s. These can be in separate rooms giving the same or separate fragrances, or to be used in sensory branding giving the range of products available, by timer or by push buttons which the customer can choose. Sensory Branding and fragrance as never been so simple, even changing the fragrance is simple just a small push fit connection and a new fragrance is ready to be used.

Free standing, commercial system which introduces fragrances into any location. Using ultrasonic technology, this system fragrances up to 1,000 m³, and its user friendly. The system requires a secure and level surface and a 13 amp socket close at hand, this takes the power supply which changes the 230 v into the safe 24 volts. Operation insert the fragrance cartridge in to the machine, this

is simply by removing the rear panel the fragrance is then installed and the pipe is placed into the fragrance container. Switch on the machine at the switch at the rear of the machine this will then start the operation of the system starting to full with the required fragrance, after 1/2 minutes the system will start to disperse the fragrance and the filling pump will stop. The controls at the rear of the system allows the dispersal time to be adjusted to give that subtle fragrance. It can be set to disperse for 20 seconds and then stop for 10 minutes, this is very adjustable and you willsoon find the correct setting to match your environment

If constant fragrance dispersal is required there is a setting for this application. Should you wish to change the fragrance you simply switch the main switch to empty and the fragrance in the machine into the container and then replace with the new one.

AF-200 Fragrance system Coverage 1.500 m³

A free standing commercial system which will introduce fragrance into any location.

Using ultrasonic technology, this system will fragrance an area of up to 1,500 m³, it is simple to operate and very user friendly. This free standing system requires a level and secure surface and a 13 amp socket. Operation, insert the fragrance container into the machines and lock the fragrance compartment, switch the system on at the rear of the machine and the system will start to fill with the selected fragrance. During this period the Red indicator located on the front of the machine will indicate it is filling. Once it has reached the required level the Red indicator will go out and the green indicator will illuminate The system is ready (This takes around 3 / 5 minutes).

The controls at the rear of the machine allows for the fragrance system to be controlled by time.

The allows the machine to disperse the fragrance and this can be set at different time period, i.e. 5 minutes dispersing the fragrance and 5 minutes delay (off) this can be set up to a maximum of 30 minutes. If constant fragrance is required turn this control fully clockwise.

The second control is for the strength of the fragrance and this can be adjusted to suite

the requirements of the client.

The system will take care of itself and will run automatically until switched off. Should you require to change the fragrance then an empty pump is fitted this is operated by a switch at the rear of the machine and allows the fragrance to be pumped back into ist container. Planter Series fragrance systems A range of planter fragrance systems that can be built into most shapes and sizes of base units with a variety of plants and bushes. The fragrance dispersal system is built into the base of the planters as is the fragrance that is to bedispersed. Fragrance is automatically dispersed and is controlled by a digital timer thatcan be set to give the maximum dispersal times depending on the locationand area to be covered. Ideal for the office, call centres or reception areas and cover up to an area of 256 square meters or a room 16 metres by 16 meters. Our range of standard fragrance or specially developed fragrance that the client requires can be used in this system.

Large commercial fragrance systems Coverage 120.000 m³

FLASH ART introduce a range of large area fragrance system.

The AF range of equipment cover every venue and application, they are all designed to be installed and self operating.

All systems come with steel cabinets which houses the fragrance so that contamination can not happen, the fragrance I also sensed so that when the fragrance requires replacing a visual indicator will show. The system feeds direct into the air movement/ air conditioning system and there is a 12 volt relay which operates when the main fan unit is running so that the AF system can not run without the fan.

The heart of the systems is the fragrance module which contains the workings of the system this includes a digital timer, boost button to increase the fragrance level, a drain button so that fragrances can be changed, and connections for external remote units that can be operated from the office/ reception.

AF-700: Self contained commercial fragrance system with a single fragrance output, when introduced into the Air movement /Air-conditioning system can cover up to 500,000 cubic feet. Uses one single nozzle mounted in the ducting system.

AF-800: Self Contained fragrance system with the ability to fragrance 2 different zones. Within a building or to introduce 2 different fragrance into the same area. When introduced into the Air movement /Air-conditioning system can cover up to 500,000 cubic feet. Uses two nozzles mounted in the ducting system.

AF-900: The ultimate in fragrance systems, with the ability to fragrance 3 different zones within the building or to introduce the symphony of fragrances by 3 different fragrance changing over a set period of time. When introduced into the Air movement /Airconditioning system can cover up to 500,000 cubic feet. Uses three nozzles mounted in the ducting system.

Note: When fragancing a room/ area the fragrance will be noticeable for persons within The connection from the main fan is by the way of a 3 core cable which is connected to the Relay unit at the 230v input side. This cable is then taken to the main fan in the air movement unit / the fan in the fragrance cannon. The connections in the motor go to the live, neutral and earth. The connection on the low voltage side is a 3 core cable which is connected to the relay switch low voltage side and taken back to the AF-system. Earth must be connected. The operation of the relay is that when the main fan is supplied with 230 v the relay contacts close and act as a switch that supplies 12 volts to the fragrance.

Remote for AF Series fragrance systems

An external remote that can be plugged into the AF-Series of fragrance dispersal modules and give the control to the office, bar, or any area that the control is required from. Operating on 12 volts DC which makes the remote save and easy to use and install. It plugs into the main AF module and a 5 core cable is then installed to the area that the remote is to be operated from. The ends are terminated in a 5 pin plug which simply screws into both ends. From the remote the client can set the operational delay and dispersal times, the operational Red LED confirms that the system is working and is in use, the Yellow LED shows when the fragrance is being dispersed and the Green LED gives the status of the fragrance .i.e. empty. Finally the boost button will allow for the timer to be overridden, and the fragrance to be dispersed by you if you require the strength to be increased. In fact the remote gives total control over the AF Series from a separate location an external unit that is wired into the AF Series of fragrance systems. This Relay is a sensing unit which sensors via a 230 v relay that the mains fan unit (air movement systems) or the Fragrance cannon fan is being supplied with 230volts and therefore it should be turning and providing the air flow required. This unit should be installed by a qualified electrician as 230 v have to be connected. The connection from the main fan is by the way of a 3 core cable which is connected to the Relay unit at the 230v input side. This cable is then taken to the main fan in the air movement unit / the fan in the fragrance cannon. The connections in the motor go to the live, neutral and earth. The connection on the low voltage side is a 3 core cable which is connected to the relay switch low voltage side and taken back to the AF-system. Earth must be connected.

The operation of the relay is that when the main fan is supplied with 230 v the relay contacts close and act as a switch that supplies 12 volts to the fragrance.

AF-25

Dimensions: 15 cm x 12 cm x 12 cm
Fragrance container 150 mls
Type of dispersal atomisation single fragrance
Voltage 12 v DC via a 230 v power supply
Stand alone, retail, point of sales, outdoor sensory branding,
Area of coverage 600 m³

AF 50

AF-100

Dimensions: 28 cm x 24 cm x 20cm
Fragrance container litres
Type of dispersal ultrasonic single fragrance
Voltage 24 v DC via a 230 v power supply
Stand alone, retail, point of sales, sensory branding,
nursing homes, receptions, bedrooms
Area of coverage: 1,000m³

AF-200

Dimensions: 31 cm x 27 cm x 26cm
Fragrance container 2.5 Litres
Type of dispersal ultrasonic single fragrance
Voltage 24 v DC via a 230 v power supply
Stand alone, retail, point of sales, sensory branding,
nursing homes, receptions, bedrooms
Area of coverage: 1,500 m³

AF 100/ 200/ 700/ 800/ 900

AF-700/800/900

Dimensions: 40 cm x 30 cm x 25 cm (700/800)
60 cm x 60 cm x 25 cm (900)
Fragrance container 5 litres
Type of dispersal atomisation
AF-700 single fragrance,
AF-800 double fragrance
AF-900 Triple fragrance Voltage 230 v
Stand alone, retail, point of sales, sensory branding, nursing homes, receptions, bedrooms
Area of coverage: 120,000 m³ via air conditioning /
air movement systems

Fragrance cannon

Dimensions: 65 cm x 65 cm x 70 cm
Fragrance container 5 litres
Type of dispersal atomisation Mod 1 single fragrance, Mod 2 triple fragrance Mod 3 five fragrance
Mod 4 eight fragrances all with DMX 512 control
Voltage 230 v
Stand alone, outdoor /indoor events, exhibitions, theatre, cinemas and gigs
